Critical Care Update Note

66F with cardiogenic shock on epi 5

Notified by RN of increased glucose. Patient changed to high dose SSI today and NPH 5 units bid added. Still remains 180-330 for glucose. Dose of steroids yesterday with IV iron and remains on epi, both contributing to hyperglycemia. Has history of DMT2 on metformin at home.

Plan

- continue high dose SSI with meals/bedtime
- increased NPH to 10 units BID, next dose in the morning
- give 10 units NPH now
- adjusted diet to carb controlled

Critical care time: 20 minutes
